

Fire Guard:-Igniting awareness in emergency situation using python programing

INTRODUCTION:-

- We have designed a application to prevent the count of fire accidents
- Our application gives the awareness' about the fire incidents and help people to escape from that tragedy
- We have developed this application using python programming

INTRODUCTION:-

- Fire emergencies present significant risks to life, property, and the environment. Rapid detection and alerting are crucial components in mitigating the impact of such emergencies.
- Fire emergency alerts serve as vital warnings, enabling swift responses from individuals, emergency services, and relevant authorities..
- Effective fire emergency alert systems not only notify occupants of a building but also provide critical information on evacuation procedures, safe routes, and additional instructions to ensure the safety of everyone involved

LITERATURE SURVEY

1. Technological Advancements:

1. Reviewing recent advancements in fire detection and alerting technologies, including sensor technologies (smoke, heat, flame detectors), communication protocols, and integration with building management systems.
2. Discussing the emergence of IoT (Internet of Things) and smart building technologies in enhancing the capabilities of fire emergency alert systems.

2. Effectiveness Evaluation:

1. Examining studies that assess the effectiveness of different types of fire emergency alert systems in terms of early detection, notification speed, evacuation efficiency, and overall outcomes in terms of property damage and loss of life.
2. Analyzing factors that influence the effectiveness of alert systems, such as system reliability, false alarm rates, and user response behavior.

LITERATURE SURVEY

1. Regulatory Frameworks and Standards:

1. Discussing regulatory requirements and industry standards that govern the design, installation, and maintenance of fire emergency alert systems, such as NFPA (National Fire Protection Association) standards, building codes, and ADA (Americans with Disabilities Act) accessibility guidelines.
2. Examining the role of regulatory compliance in ensuring the reliability and effectiveness of alert systems, as well as challenges and gaps in current regulations.

2. Case Studies and Real-World Implementations:

1. Reviewing case studies and real-world examples of fire emergency alert systems deployed in various settings, including commercial buildings, residential complexes, healthcare facilities, educational institutions, and public spaces.
2. Analyzing the implementation process, challenges encountered, lessons learned, and outcomes achieved in terms of improving emergency preparedness and response.

EXISTING WORK

- "Evaluation of Fire Detection and Alarm Systems" by David L. Shearer and Joshua Dina burg. This study evaluates the performance of various fire detection and alarm systems in different building environments, providing insights into their effectiveness and reliability.
- "Human Behavior in Fire Emergencies: Implications for Research, Design, and Education" by Daniel T. Gottuk et al. This research explores human behavior in fire emergencies, including responses to fire alarms and evacuation procedures, offering valuable insights for improving the design and implementation of alert systems.

HARDWARE AND SOFTWARE

- HARDWARE:-
- Laptop

- SOFTWARE:-
- Windows 10
- Intel i5
- IDLE

PROPOSED MODEL

- FIRE LIFE HACKS:-

1. We have proposed a fire emergency alert system which is updated and innovated .
2. It is the best application that will give the fire life hacks to the people and helps in the decreasing the dead or damage rate of people caused by the fire

FIRE ALERT	
FIRE EMERGENCY 	
DO'S	DON'TS
Activate the Fire Alarm 	Don't use the elevator to evacuate from fire. 
 Immediately go to the Fire exit	Don't open hot doors during fire 
Turn off electrical equipments 	Do not hide in any furniture or room 
 Use the fire extinguisher if safe to do so	Do not return to get your belongings 
Gather at an assembly point 	Do not jump through a window 

CODING:-

- `import time`
- `def fire_escape_instructions():`
- `"""Displays fire escape instructions."""`
- `print("**** Fire Emergency Escape Instructions ****")`
- `print("1. Stay calm and move quickly but carefully.")`
- `print("2. Alert others in the area and activate the fire alarm if possible.")`
- `print("3. Feel doors for heat before opening them.")`
- `print("4. If the door is hot, do not open it. Look for another way out.")`
- `print("5. If the door is cool, open it slowly and carefully.")`
- `print("6. Crawl on the floor to avoid smoke inhalation.")`
- `print("7. Close doors behind you to slow the spread of fire.")`
- `print("8. Go to your designated meeting place.")`
- `print("9. Call emergency services from a safe location.")`
- `print("*****")`

```
def main():
    """Displays fire escape instructions and waits for user input."""
    while True:
        print("\nWelcome to the Fire Emergency Escape Instructions App!")
        print("1. Display instructions")
        print("2. Exit")
        choice = input("Enter the number of your choice: ")
        if choice == "1":
            fire_escape_instructions()
        elif choice == "2":
            print("Exiting the app...")
            break
        else:
            print("Invalid choice. Please try again.")

if __name__ == "__main__":
    main()
```

RESEARCH GAP

- We have developed the fire emergency alert system that which gives the fire accident information to the user
- It gives 2 options to the user .
 1. You have stuck in fire
 2. You are outside of fire
- According to the user situation the application gives the instructions

CONCLUSION

- We are finally concluding that our application could help the society and can save many people lives
- Our main goal is to make every person in the society should know about our application and learn the information about the fire accidents
